

Date: 20th May to 26th May

Week 1: Introduction to Python Programming

Summary:

Which we concepts learned:

- This week, I learned the basics of Python programming. I studied variables, different data types such as integers, floats, strings, and booleans, as well as arithmetic and comparison operators. I also learned how to take input from users and display output using Python.
- I practiced decision-making using if-else statements and learned how to repeat tasks using for and while loops. To strengthen my understanding, I created a temperature converter and a simple calculator. These projects helped me understand how to use user input, perform calculations, and display results.
- I further improved the temperature converter by allowing users to enter multiple temperature values and converting all of them from Celsius to Fahrenheit. While doing this, I learned how to work with lists, loops, list comprehensions, and the zip() function.
- For the client project, I developed a script to calculate the average temperature from a set of temperature readings. This gave me experience in basic data processing and working with collections of data.
- Overall, Week 1 helped me build a solid foundation in Python and gave me confidence in writing simple programs independently.
