

Date: 27th May to 3rd June

Week 2: Data Structures and Functions

Summary:

- This week, I learned about Python data structures such as lists, tuples, dictionaries, and sets. I also studied functions and understood how they help organize code and make programs reusable. In addition, I learned about lambda functions, recursion, and the basic concepts behind data transformation and filtering.
- For the hands-on projects, I created a program to calculate the sum of squares of numbers using functions and loops. I also developed a program to filter prime numbers from a list. These activities helped me improve my understanding of loops, conditional statements, functions, and working with collections of data.
- For the client project, I created a data cleaning script that removes duplicate values and filters out unwanted data. Through this project, I learned how to process raw data and prepare it for further analysis. It also helped me understand the practical use of lists, sets, and functions in solving real-world problems.
- Overall, Week 2 strengthened my understanding of Python data structures and functions. I became more comfortable with writing programs that manipulate and filter data, and I gained confidence in using Python to solve practical problems.
