

Date: 4th June to 10th June

Week 3: NumPy and Pandas for Data Manipulation

Summary:

- This week, I learned how to use NumPy and Pandas for data manipulation and analysis. I studied NumPy arrays and learned how to perform operations such as addition, multiplication, finding averages, and working with array data efficiently. I also learned about Pandas Series and DataFrames, which are useful for organizing and analyzing tabular data.
- For the hands-on project, I worked on a marksheet analysis program. I created a dataset of student marks and used NumPy and Pandas to analyze the data. I calculated average marks, identified high-scoring students, and practiced filtering and displaying specific information from the dataset. This helped me understand how NumPy and Pandas can be used together for data analysis tasks.
- For the client project, I created a simple company dataset containing employee and performance-related information. Since the dataset was created, I was able to practice organizing data into a DataFrame, cleaning the data, and performing basic analysis. I calculated averages and generated simple insights from the data, which helped me understand the importance of data preparation before analysis.
- Overall, Week 3 improved my understanding of data manipulation using NumPy and Pandas. I gained practical experience in cleaning, organizing, and analyzing datasets, and I became more comfortable working with DataFrames and performing basic data analysis tasks.
